

## EndoTrap™

EndoTrap™ is a simple protective product designed to reduce the exposure of endoscopists to airborne particles generated during endoscopic procedures.

EndoTrap™ consists of a T-piece and a protective sleeve and is intended to be used in conjunction with a single-port anaesthesia mask and a viral filter. EndoTrap™ is designed so that all inhaled and exhaled gases pass through the viral filter. Within EndoTrap's T-piece lies the protective sleeve, which when pulled out covers the endoscope, preventing gases escaping alongside the scope and protecting the operator from harmful biological contaminants.

## Product Features

- Enhances safety for endoscopists and nurses during endoscopic procedures
- Forms a protective barrier around the patient's nose and mouth and the endoscope
